

Power Distribution Panels

Install your complete power distribution panel, attach the harness, power and ground and drive away. You save space, time and expense with a Data Panel Power Distribution Panel. Each device is configured to the application, yet there is spare capacity for the last-minute option or dealer add-ons.

All your flashers, timers, dimmers, isolators, load managers/sequencers, disconnects and relay controls are conveniently packaged, organized and tested, and are ready for install.

Further reductions in size with large increases in flexibility are available with Data Panel's microprocessor-based distribution system, the *dpx*[™] Advanced Power Distribution System (APDS). Most of the components bolted into a traditional system can be included in the software, offering substantial design flexibility and diagnostic capability in this state-of-the-art, solid state system.

Specification

Data Panel's engineering staff works with customers to fully understand each application. Only then do we document a complete set of design, development, and performance specifications

Design

Data Panel performs all electrical design and board layout in house – controlling every aspect of the development process.

Prototype

When required and/or requested, quick turn production intent prototypes can be developed to prove the design application.

Production

Our manufacturing group has a broad range of production experience and personnel. Just-In-Time deliveries support numerous rescue vehicle manufactures.

Field Support

Field Service personnel are always available to provide answers, service, and support for our customers and their customers!
